## Introduction

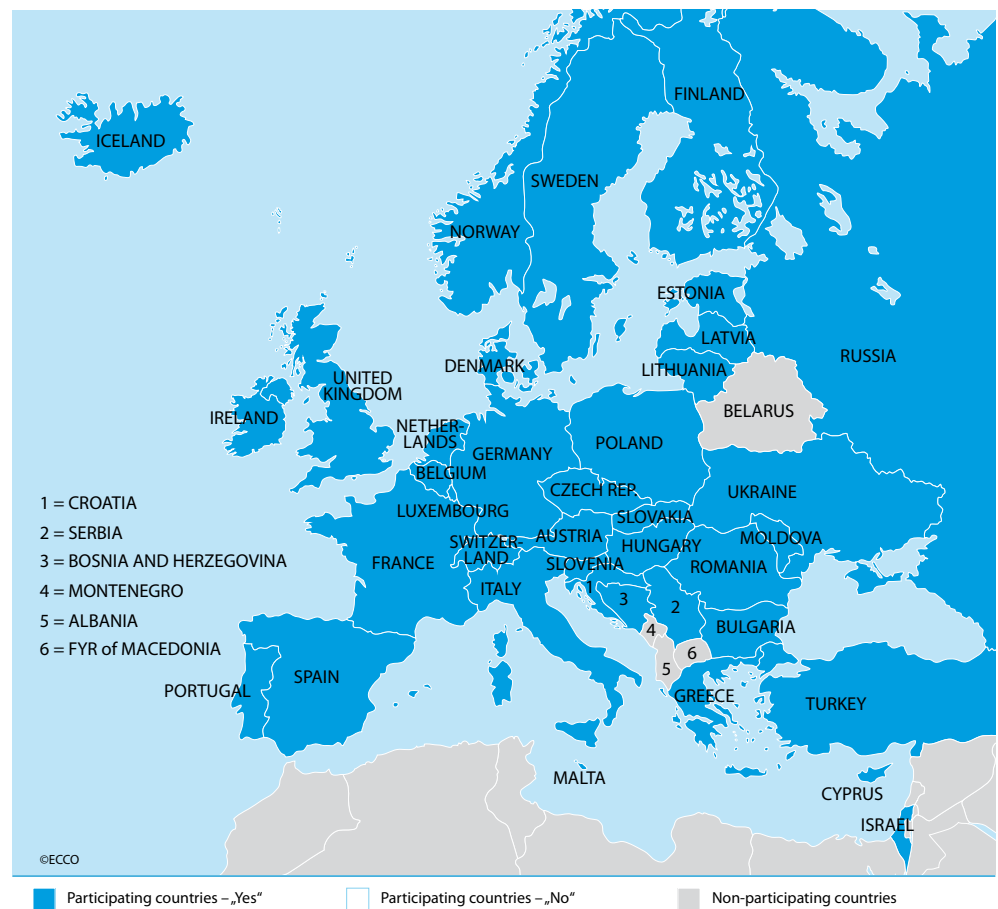

The 2015 EpiCom survey evaluated population, patient and research registries across Europe. Information was collected from 38 countries. The registries included those falling within the remit of National Statistics, Hospital Databases, Twin and Multiplex Registries, IBD Registries and Biobanks and Cancer and Surgical Registries. The scale (i.e. local or national) and nature (i.e. public or private) of registries was also investigated.

Despite heterogeneity between countries, the registries represent an invaluable source of information for future IBD research.

The maps in this document illustrate the participating countries that answered positively to having a registry for each of the sixteen questions of the EpiCom Survey.

**Disclaimer:** This document is supplementary material. This document and the individual maps it contains should always be cited in conjunction with the attached article, The EpiCom Survey – Registries across Europe.
